ABSTRACT

In the modern world, it is essential to reduce the wastage of unused resources at the airports. So here we are, minimizing the utilization of unused or minimum used resources of airports using barcode scanner.

It is difficult to analyze which resources are in high demand and which are not used, we can moderate the resources and reduce their cost by using barcodes. Barcode is a visual representation of information in the form of bars and spaces on a surface. With the help of barcodes present on government authorised identities of people we can know which resources they have utilised.

This idea can be developed with the help of barcodes, barcode - scanners, HTML, PHP with MYSQL Database.
